SVF: Static Value-Flow Analysis in LLVM

Yulei Sui, Peng Di, Ding Ye, Hua Yan and Jingling Xue

School of Computer Science and Engineering
The University of New South Wales
2052 Sydney Australia

March 18, 2016

Outline

- Static Value-Flow
- SVF Overview
- SVF Internals
- Results and Client Applications

Static Value-Flow Analysis

Statically resolves both control and data dependence of a program.

- Does the information generated at program point *A* flow to another program point *B* along some execution paths?
- Is there an unsafe memory access that may trigger a bug?

Static Value-Flow Analysis

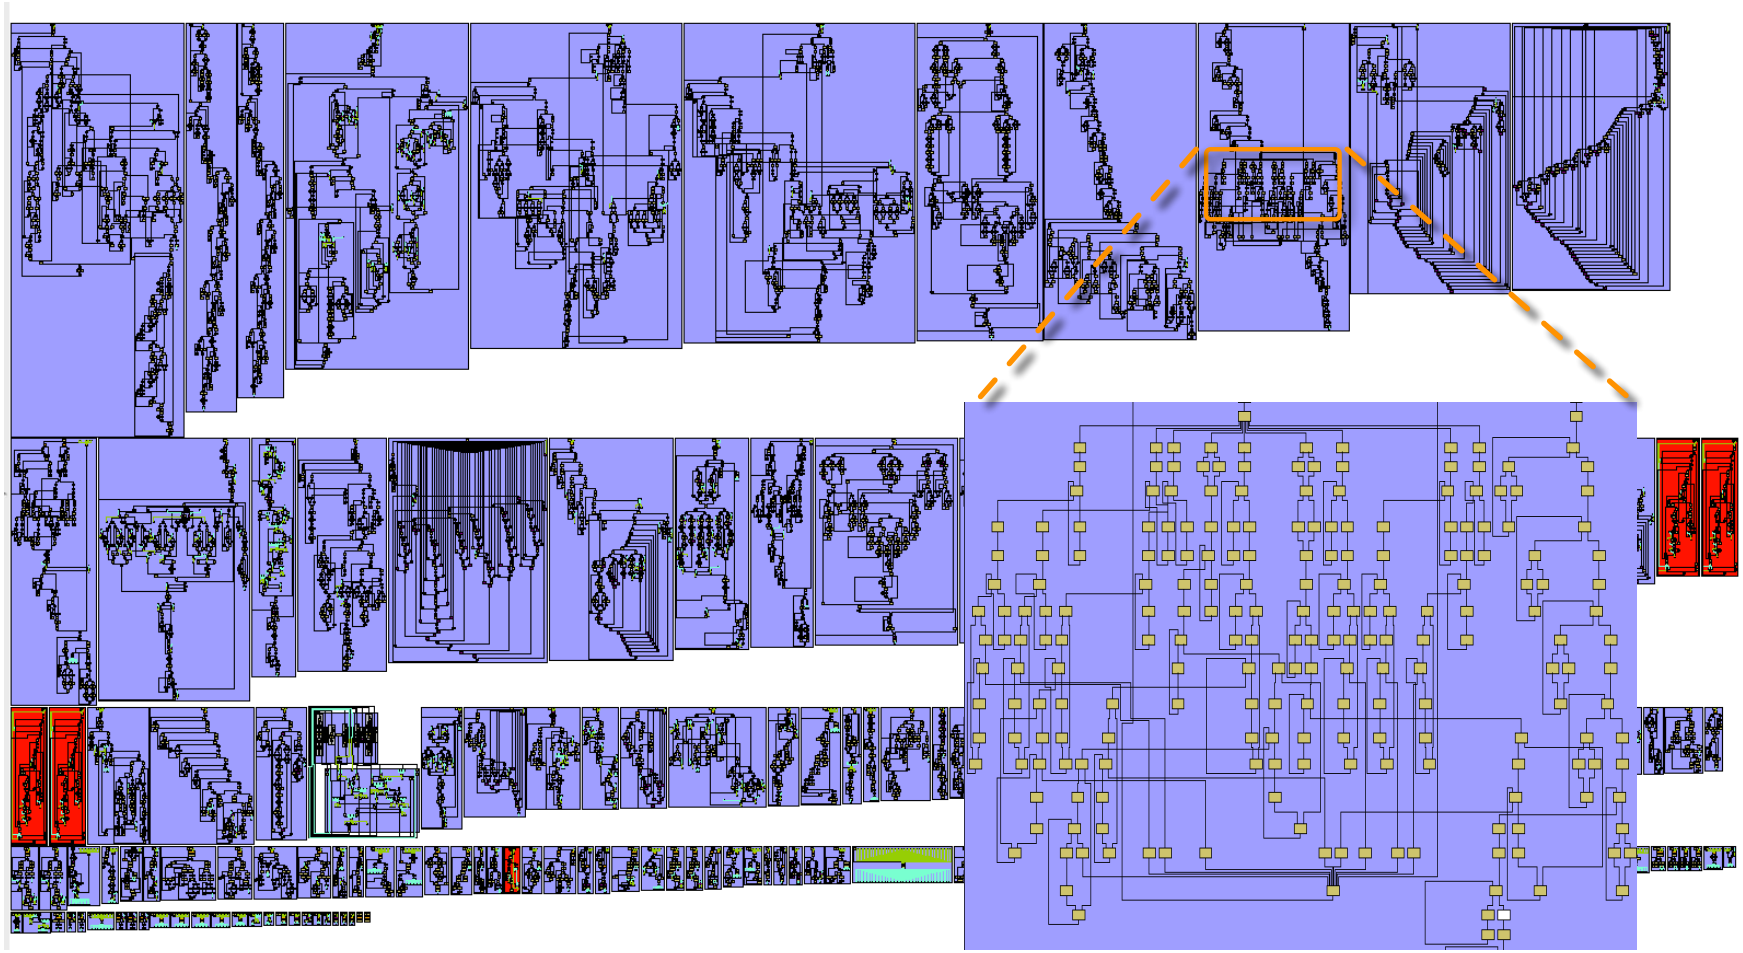
Statically resolves both control and data dependence of a program.

- Does the information generated at program point *A* flow to another program point *B* along some execution paths?
- Is there an unsafe memory access that may trigger a bug?

Value-flow (def-use) of a variable

- Def-use of a top-level pointer (register value) is explicit on LLVM SSA.
- Def-use of an address-taken variable (allocated memory objects) is hard to compute precisely and efficiently.

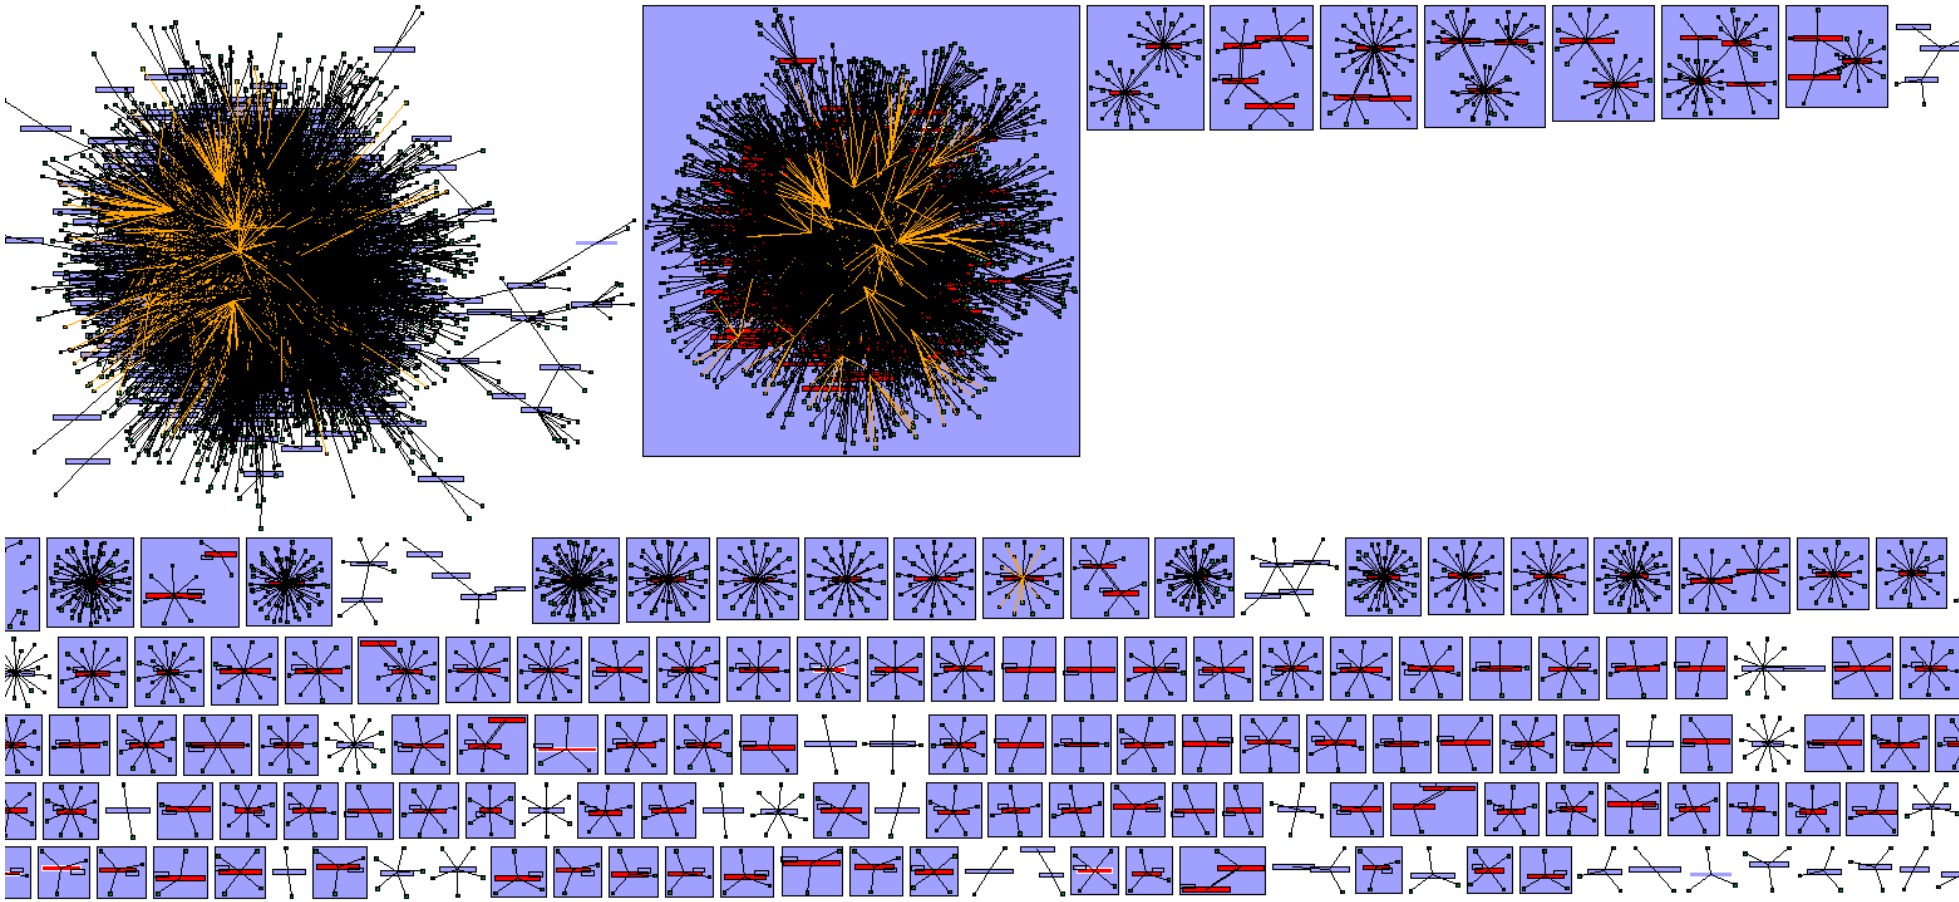
Whole-Program CFG of 300.twolf (20.5KLOC)



#functions: 194 #pointers: 20773 #loads/stores: 8657

Costly to reason about flow of values on CFGs!

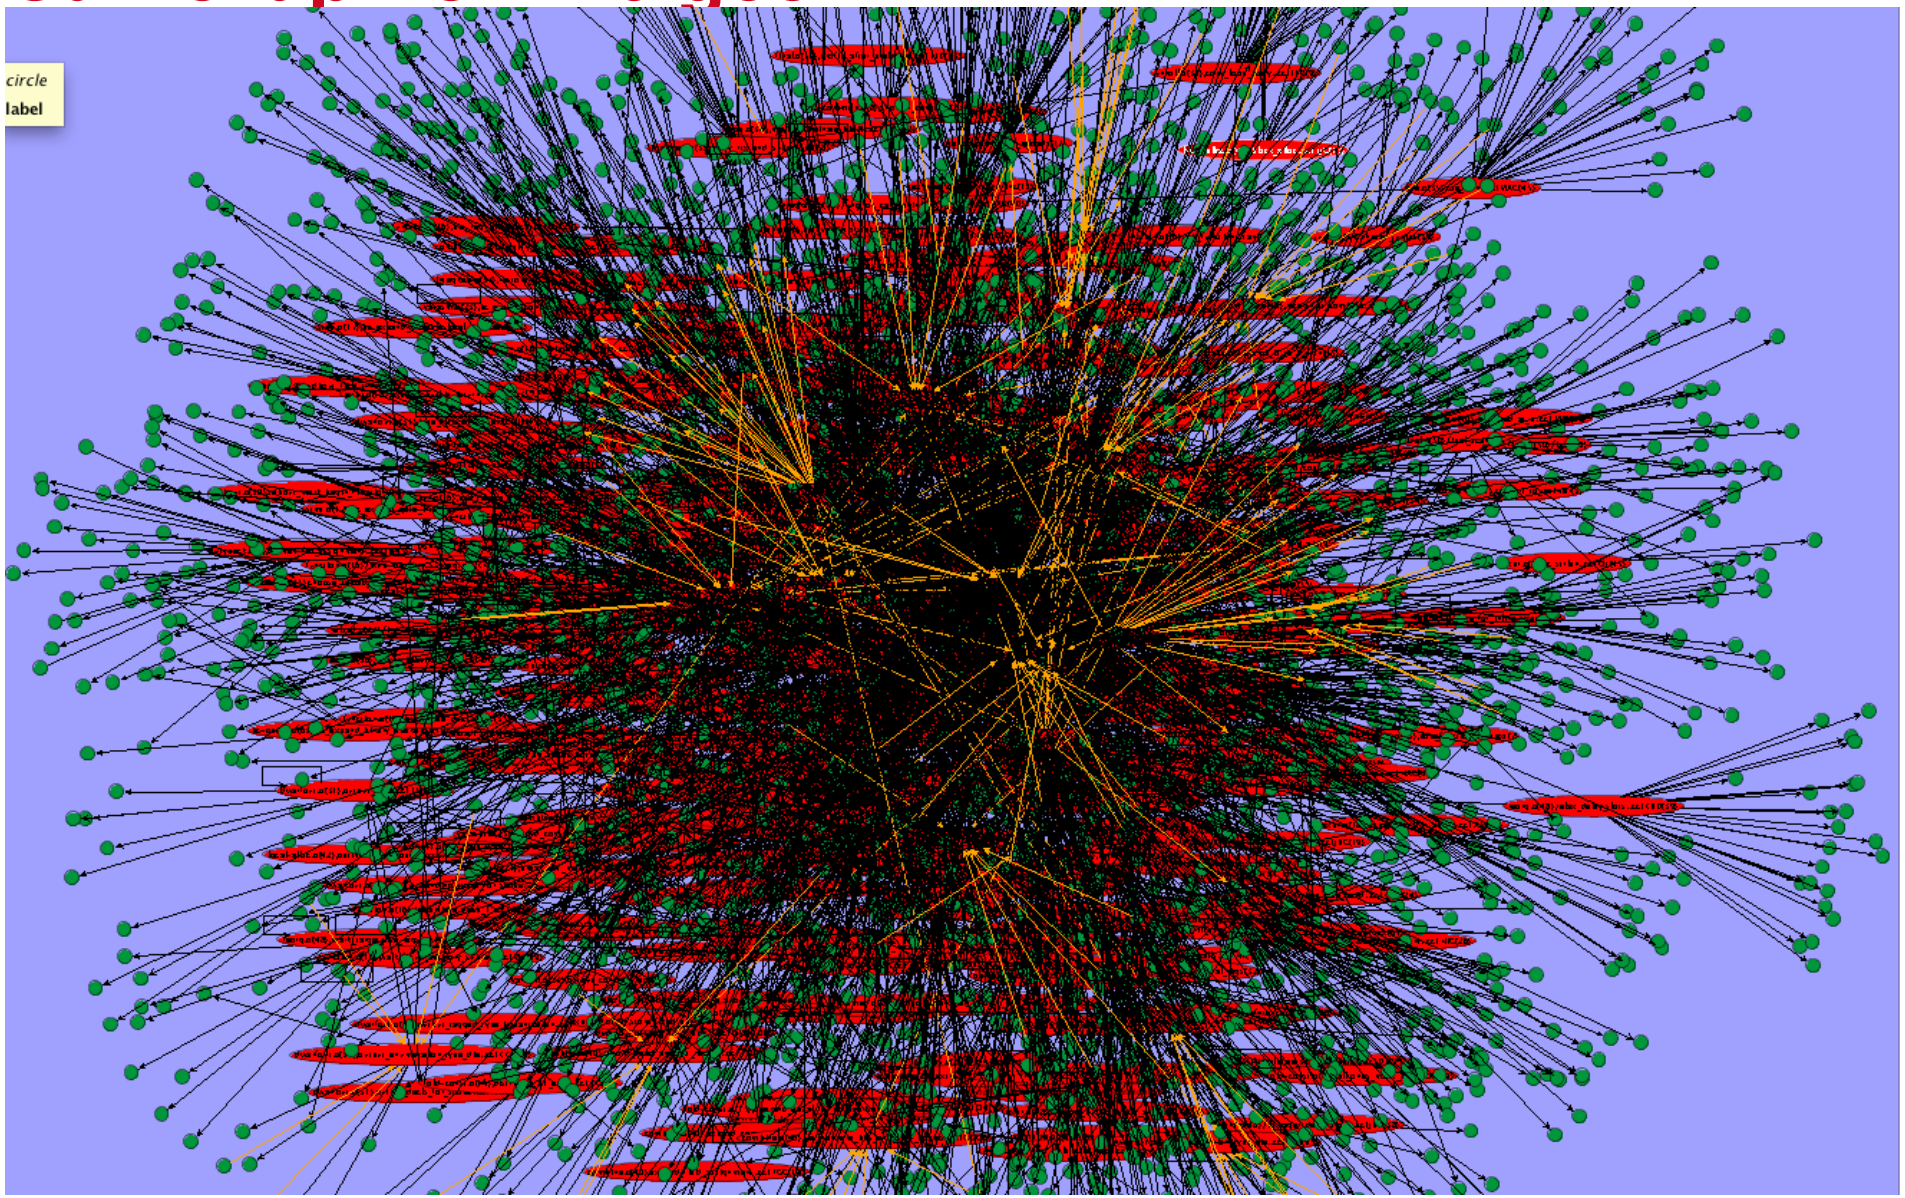
Call Graph of 176.gcc



#functions: 2256 #pointers: 134380 #loads/stores: 51543

Costly to reason about flow of values on CFGs!

Call Graph of 176.gcc



Motivation

Why need an interprocedural static value-flow analysis in LLVM?

- **Bridge the gap between research and engineering**
  - *Support developing different analysis variants (flow-, context-, heap-, field-sensitive analysis)*
  - *Minimize the efforts of implementing sophisticated analysis. (extendable, reusable, and robust via layers of abstractions)*

Motivation

Why need an interprocedural static value-flow analysis in LLVM?

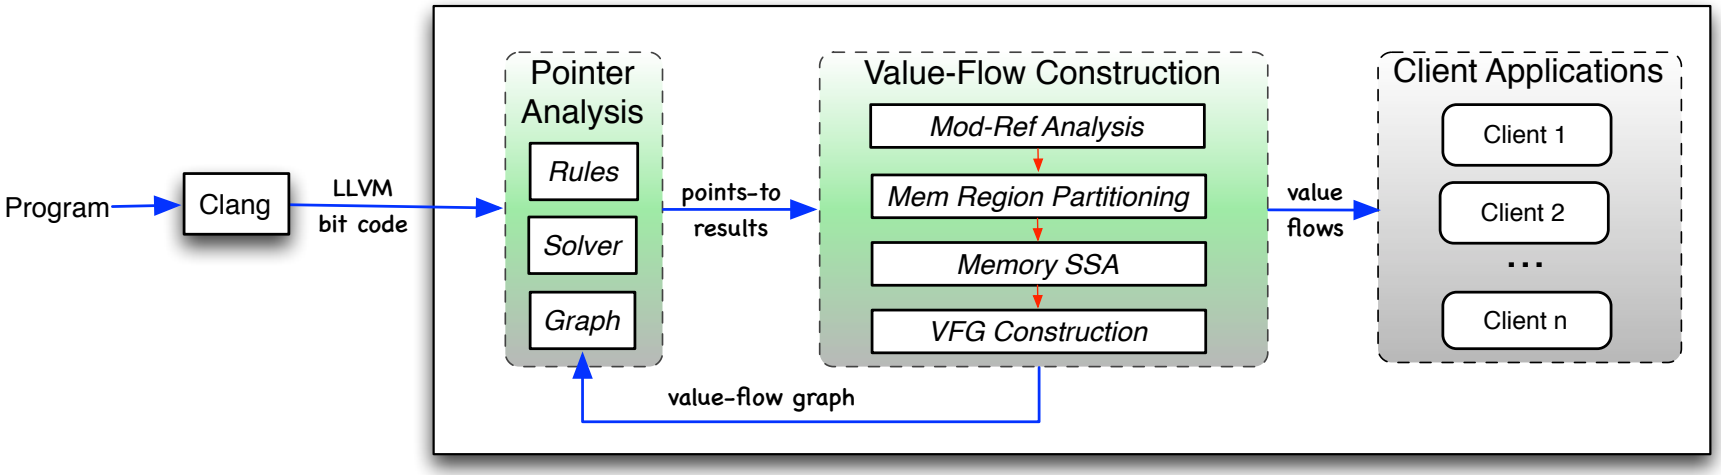
- **Bridge the gap between research and engineering**
  - *Support developing different analysis variants (flow-, context-, heap-, field-sensitive analysis)*
  - *Minimize the efforts of implementing sophisticated analysis. (extendable, reusable, and robust via layers of abstractions)*
- **Client applications**:
  - *Static bug detection (e.g., memory leak, data-race)*
  - *Sanitizers (e.g., MSan, TSan)*
  - *Program understanding and debugging*

Motivation

Why need an interprocedural static value-flow analysis in LLVM?

- **Bridge the gap between research and engineering**
  - *Support developing different analysis variants (flow-, context-, heap-, field-sensitive analysis)*
  - *Minimize the efforts of implementing sophisticated analysis. (extendable, reusable, and robust via layers of abstractions)*
- **Client applications**:
  - *Static bug detection (e.g., memory leak, data-race)*
  - *Sanitizers (e.g., MSan, TSan)*
  - *Program understanding and debugging*
- **LLVM community support**
  - *Industrial-strength compiler with well-defined IR*
  - *Front-ends that support many different languages*
  - *Many active program analysis researchers and engineers*

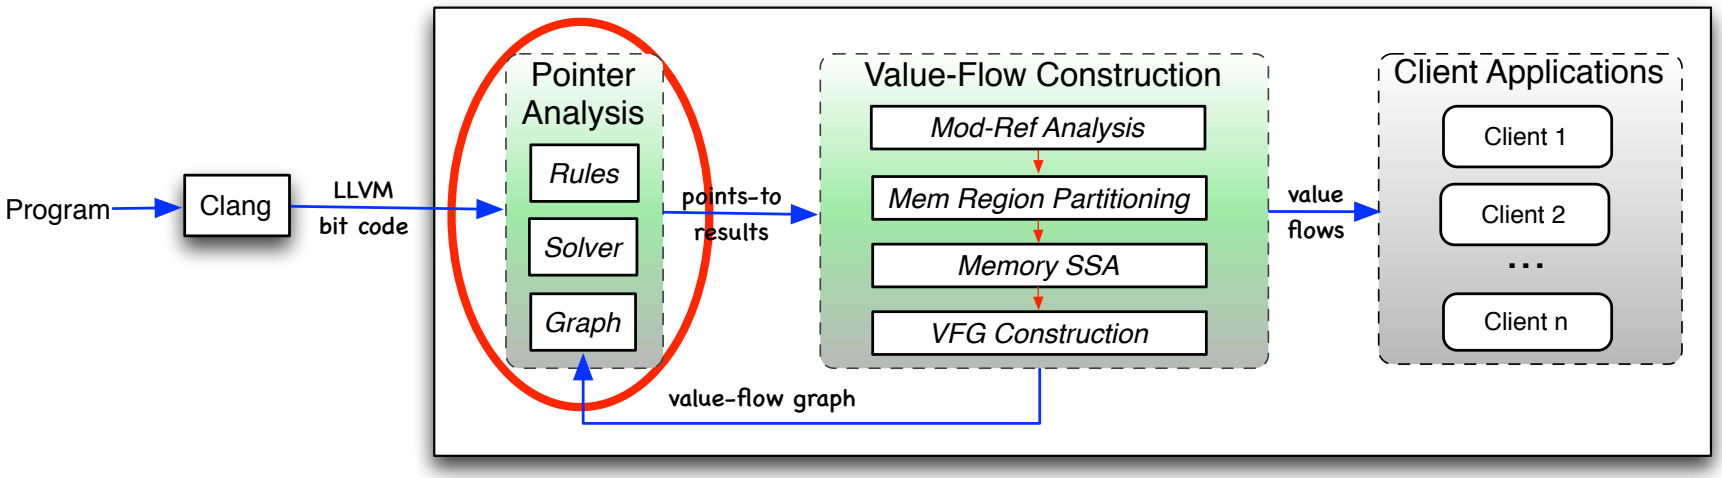
SVF Overview



A research tool supports refinement-based interprocedural program dependence analysis on top of LLVM.

- Pointer analysis and Value-flow construction are performed iteratively to provide increasingly improved precision for both.
- The project initially started from 2013 on LLVM-3.3. Now it supports LLVM-3.7.0 with around 50KLOC C++ code.
- Publicly available at: `http://unsw-corg.github.io/SVF/`

SVF Overview

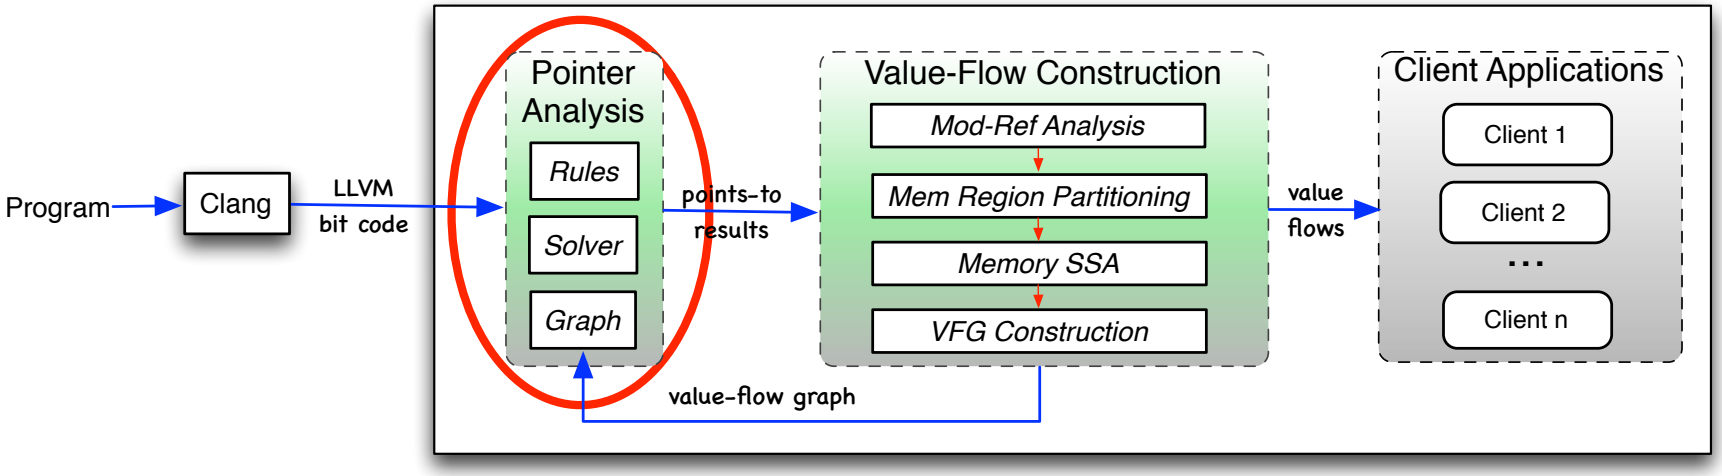


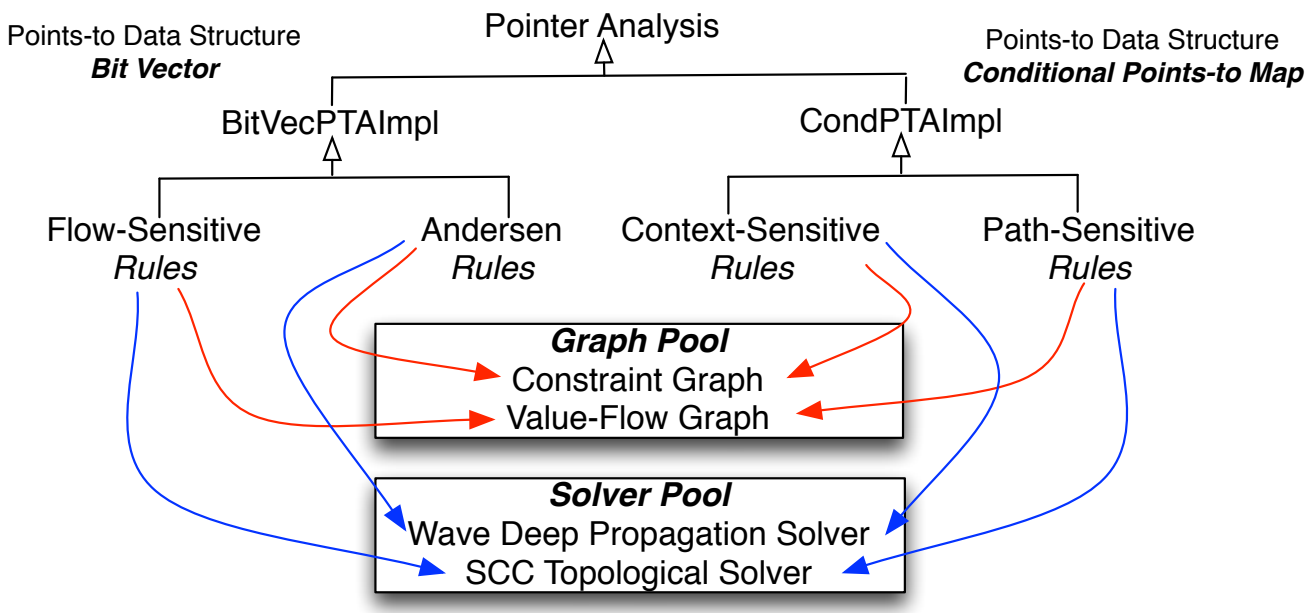
Support developing different analyses (flow-, context-, field-sensitivity)

- Graph is a higher-level abstraction extracted from the LLVM IR indicating ***where*** pointer analysis should be performed.
- Rules defines ***how*** to derive the points-to information from each statement,
- Solver determines in ***what*** order to resolve all the constraints.

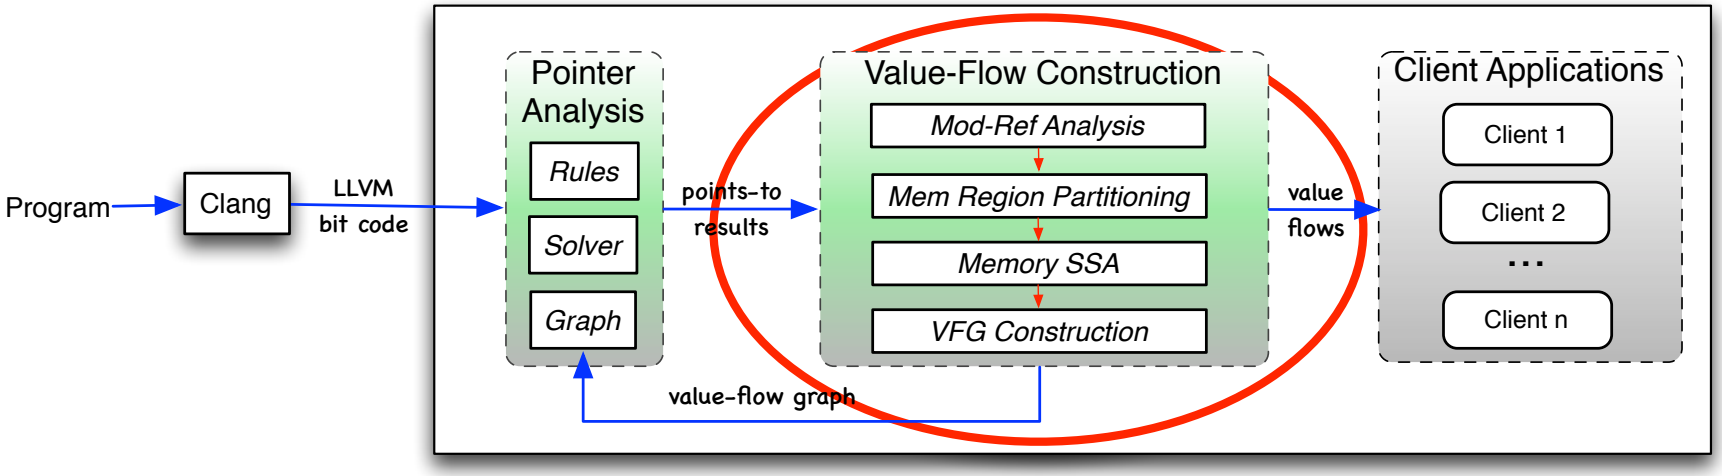
More details can be found at `https://goo.gl/msaVba`.

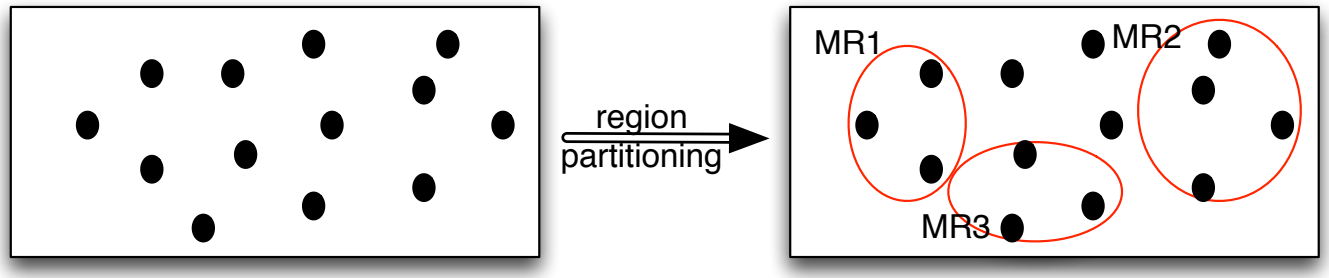
SVF Overview





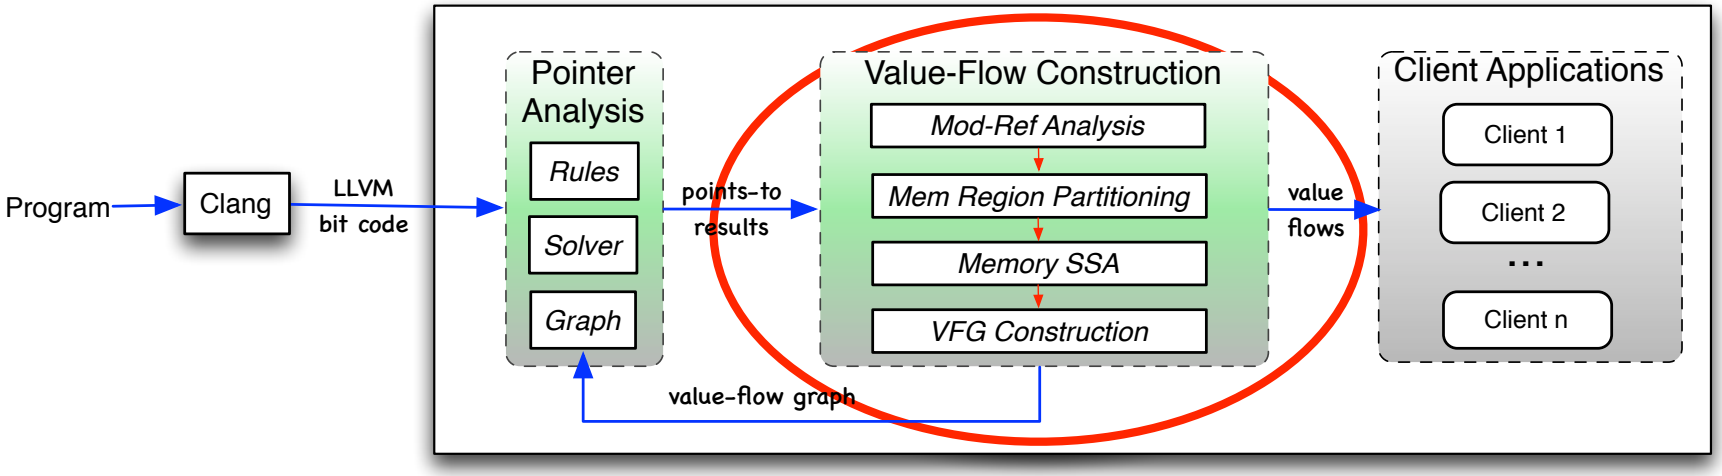
SVF Overview





Partition the memory objects into memory regions are accessed equivalently

SVF Overview

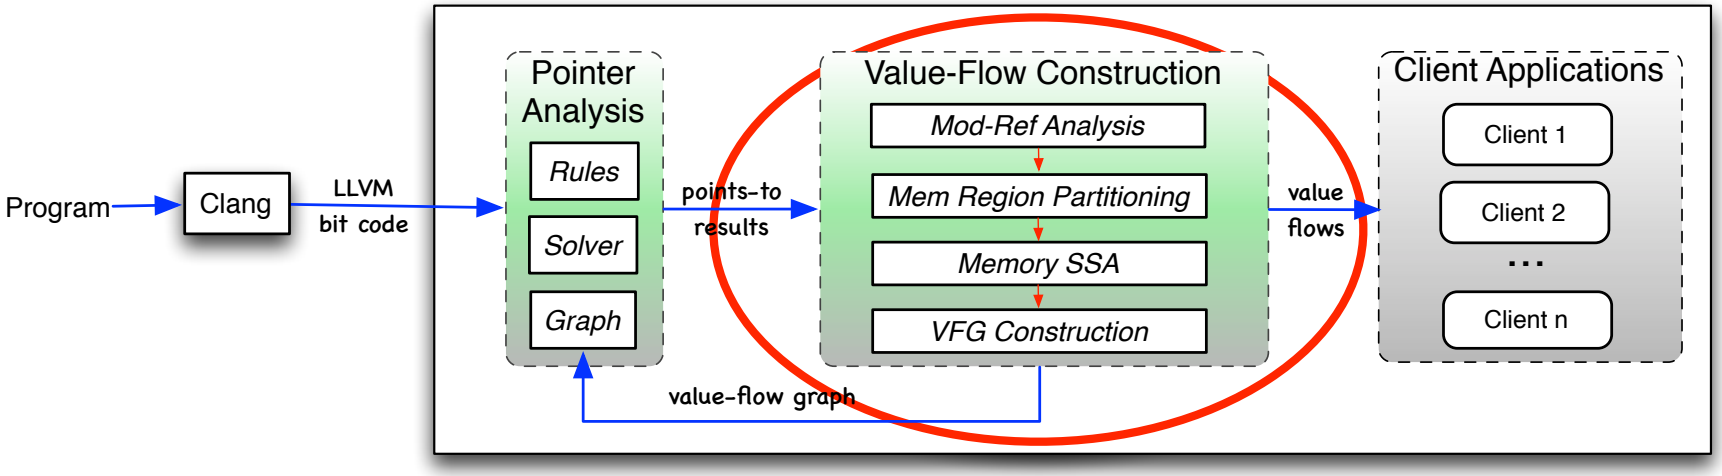


Interprocedural memory SSA construction based on HSSA (CC '96[a]) and widely used in Open64.

- **Side-Effect Annotation** at loads/stores and callsites
- **Placing Memory SSA** ϕ for memory regions.
- **SSA Renaming** for regions with different versions:

[a] F Chow, S Chan, SM Liu, R Lo, M Streich, *Effective representation of aliases and indirect memory operations in SSA form*, CC 1996

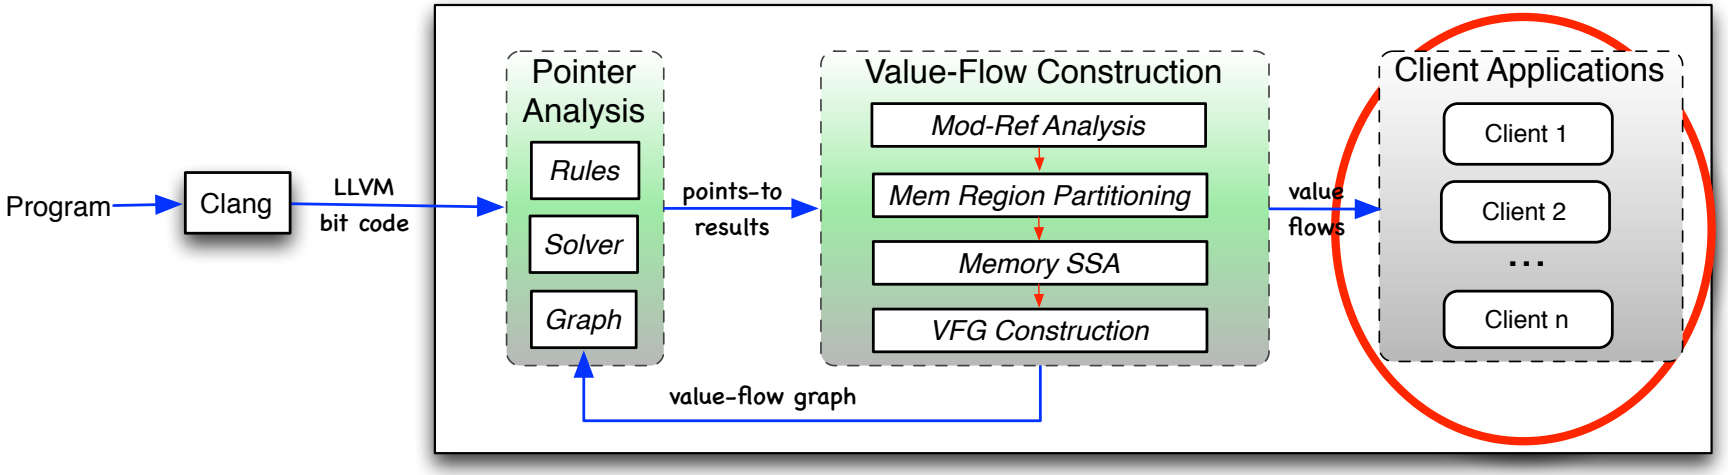
SVF Overview



Value-Flow Construction:

- **Direct Value-Flows**: def-use of top-level pointers
- **Indirect Value-Flows**: def-use of address-taken variables based on memory SSA

SVF Overview



- Advanced pointer analyses (SAS '14, SPE '14, CGO '16)
- Memory leak detection (ISSTA '12, TSE '14, SAC '16)
- Accelerating dynamic analysis including temporal memory safety (CGO '14), spatial memory safety (ISSRE '14, TOR '16)
- Value-flow analysis for multithreaded programs(ICPP '15, CGO '16, PMAM '16)

Andersen's Pointer Analysis

SVF transforms LLVM instructions into a graph representation

Constraint Graph (Design doc: `https://goo.gl/Q8mxFw`)

- Node:
  - A pointer: (LLVM Value in pointer type)
  - An object: (heap, stack, global, function)
- Edge: A Constraint between two nodes

Address	p	= alloc$_{obj}$
Copy	p	= q
Load	p	= *q
Store	*p	= q
Field	p	= q *gep* f

Andersen's Pointer Analysis

SVF transforms LLVM instructions into a graph representation

Constraint Graph (Design doc: `https://goo.gl/Q8mxFw`)

- Node:
  - A pointer: (LLVM Value in pointer type)
  - An object: (heap, stack, global, function)
- Edge: A Constraint between two nodes

Address	p = alloc$_{obj}$	$\{obj\} \subseteq \text{Pts}(p)$
Copy	p = q	$\text{Pts}(p) \subseteq \text{Pts}(p)$
Load	p = *q	$\forall o \in \text{Pts}(q), \text{Pts}(o) \subseteq \text{Pts}(p)$
Store	*p = q	$\forall o \in \text{Pts}(p), \text{Pts}(q) \subseteq \text{Pts}(o)$
Field	p = q *gep* f	$\forall o \in \text{Pts}(q), o.f \subseteq \text{Pts}(p)$

Andersen's Pointer Analysis

```
1  struct st{
2        char f1;
3        char f2;
4  };
5  typedef struct st ST;
6
7  int main(){
8        char a1; ST st;
9        char *a = &a1;
10       char *b = &(st.f2);
11       swap(&a,&b);
12 }
13 void swap(char **p, char **q){
14       char* t = *p;
15       *p = *q;
16       *q = t;
17 }
```

- SVF Internals
  - Pointer Analysis
  - Interprocedural Memory SSA
  - Value-Flow Construction
  - Supporting Multithreaded Programs
- Results and Client Applications

Memory SSA

Memory SSA is constructed per procedure given the global points-to information after region partitioning.

Memory SSA

Memory SSA is constructed per procedure given the global points-to information after region partitioning.

- Side-effect annotation.
  - **Load**: $p = *q$ is annotated with a $\mu(o)$ for each variable $o \in \text{Pts}(q)$.
  - **Store**: $*p = q$ is annotated with a $o = \chi(o)$ for each variable $o \in \text{Pts}(p)$.
  - **Callsite**: *foo*(...) is annotated with $\mu(o)/\chi(o)$ if o is referred or modified inside caller *foo*.
  - **Function entry/exit**: $\chi(o)/\mu(o)$ is annotated at the entry of a function (e.g., foo) if o is referred or modified in *foo*.

Memory SSA

Memory SSA is constructed per procedure given the global points-to information after region partitioning.

- Side-effect annotation.
  - **Load**: $p = *q$ is annotated with a $\mu(o)$ for each variable $o \in \text{Pts}(q)$.
  - **Store**: $*p = q$ is annotated with a $o = \chi(o)$ for each variable $o \in \text{Pts}(p)$.
  - **Callsite**: *foo*(...) is annotated with $\mu(o)/\chi(o)$ if o is referred or modified inside caller *foo*.
  - **Function entry/exit**: $\chi(o)/\mu(o)$ is annotated at the entry of a function (e.g., foo) if o is referred or modified in *foo*.
- Memory SSA construction
  - **Placing Memory SSA** ϕ for memory objects.
  - **Renaming** objects with different versions:
    - $\mu(o)$ is treated as a use of o.
    - $o = \chi(o)$ is treated as both a def and a use of o.

Value-Flow Graph

UNSW THE UNIVERSITY OF NEW SOUTH WALES

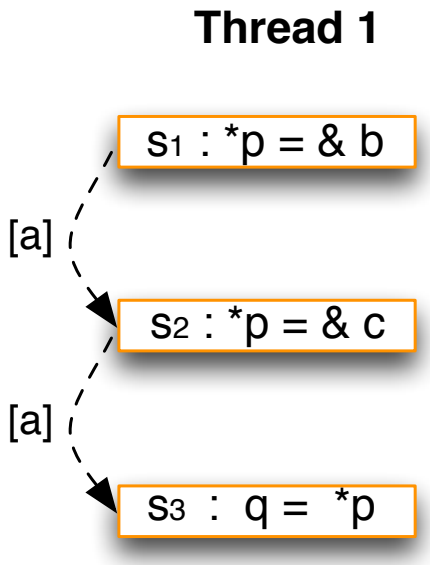
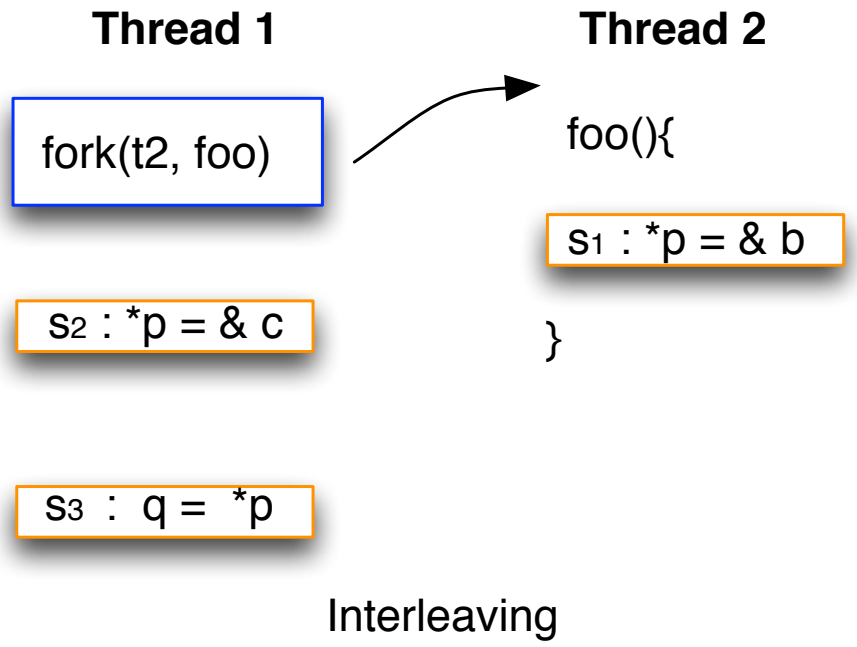
Outline

- Static Value-Flow
- SVF Overview
- SVF Internals
  - Pointer Analysis
  - Interprocedural Memory SSA
  - Value-Flow Construction
  - Supporting Multithreaded Programs
- Results and Client Applications

Value-Flow Under Thread Interleaving

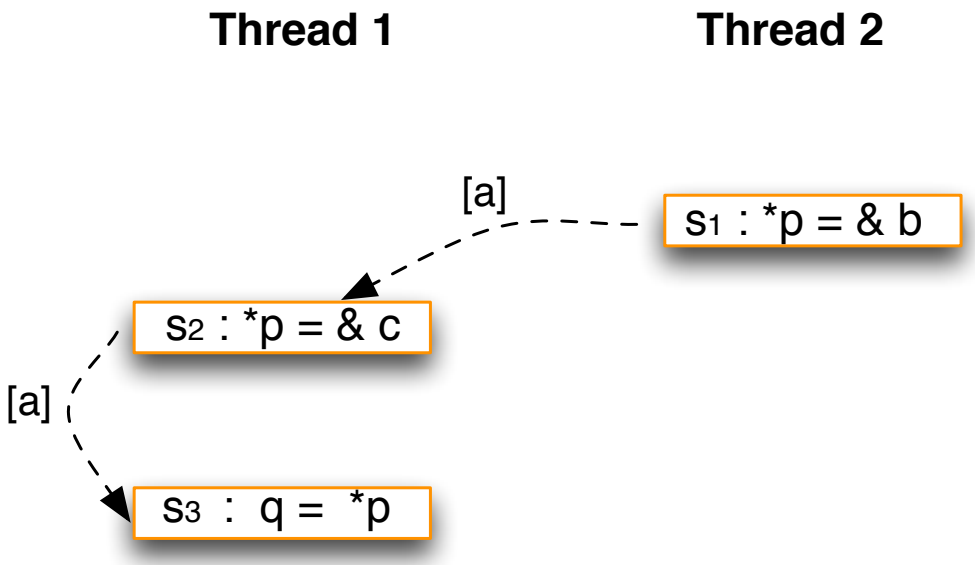


Value-Flow Under Thread Interleaving



Value-Flow Under Thread Interleaving

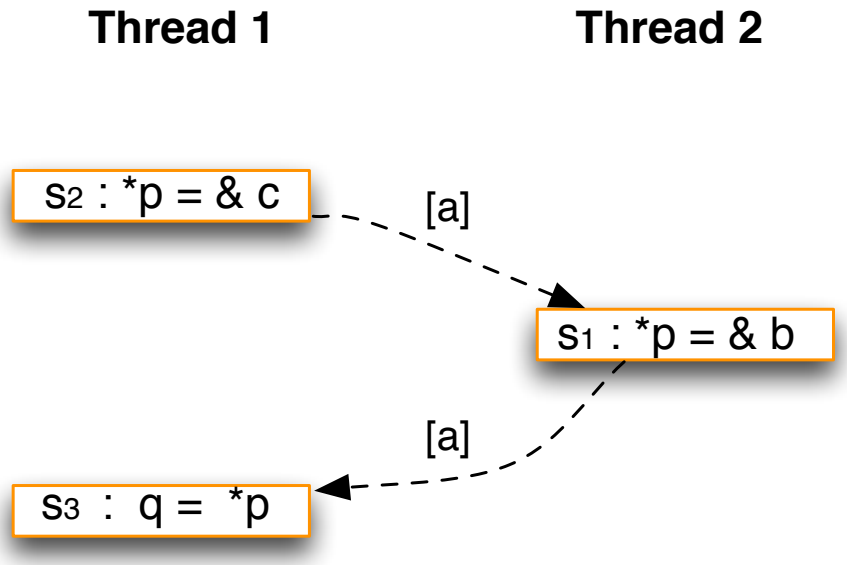
Scenario 1:



execution sequence : s_1, s_2, s_3

Value-Flow Under Thread Interleaving

Scenario 2:

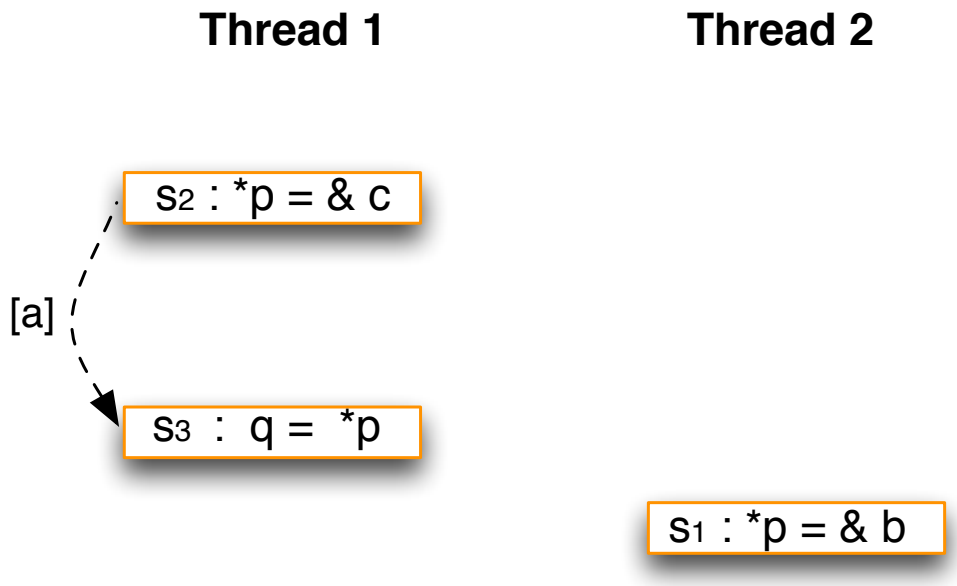


execution sequence : s_1, s_2, s_3

execution sequence : s_2, s_1, s_3

Value-Flow Under Thread Interleaving

Scenario 3:

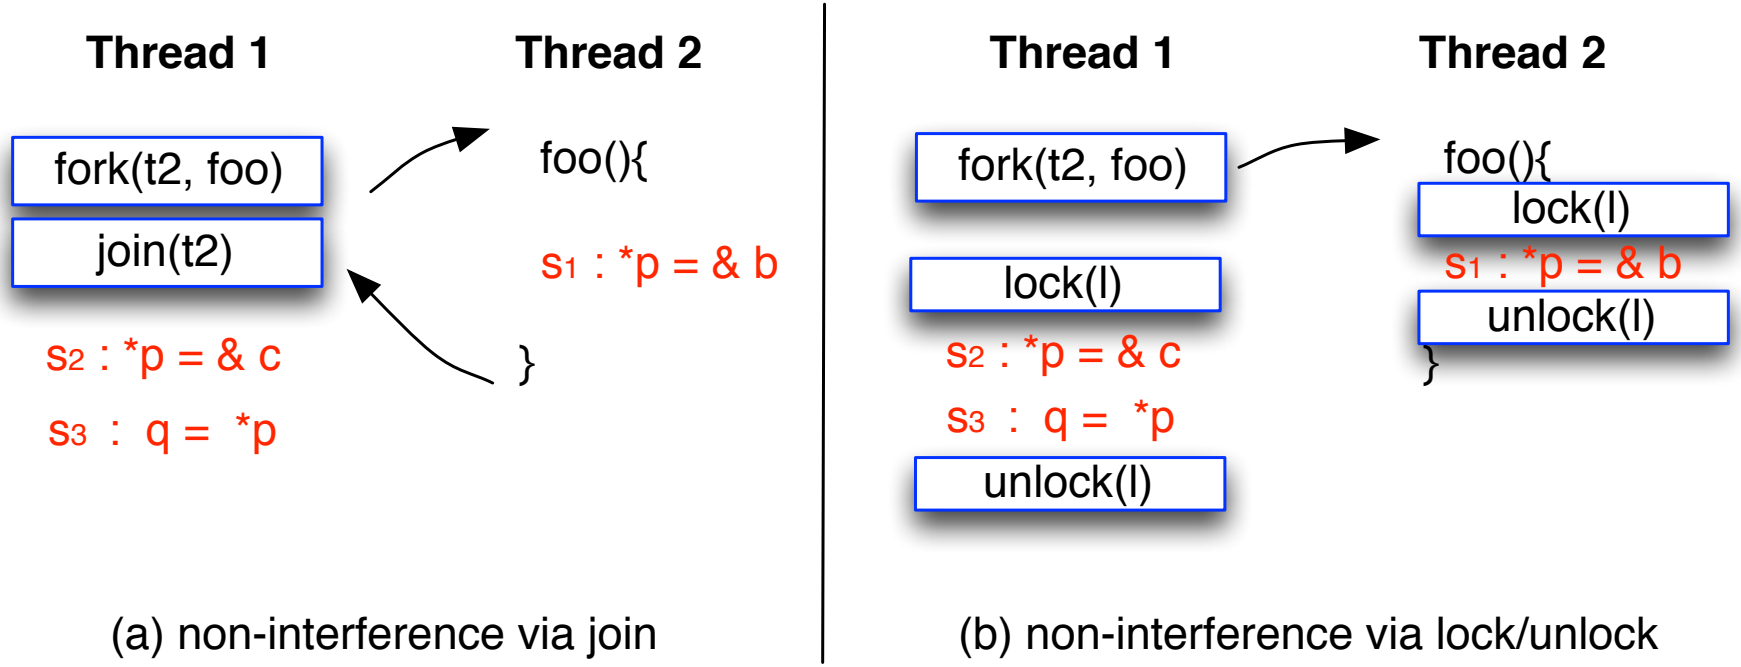


execution sequence : s_1, s_2, s_3

execution sequence : s_2, s_1, s_3

execution sequence : s_2, s_3, s_1

Value-Flow Under Thread Interleaving



(a) non-interference via join

(b) non-interference via lock/unlock

Supporting Multithreaded Programs (CGO '16)

- Thread-oblivious value-flows(Ignore Pthread APIs)
- Thread-aware value-flows
  - Fork-join
  - Memory access
  - Lock/unlock

Outline

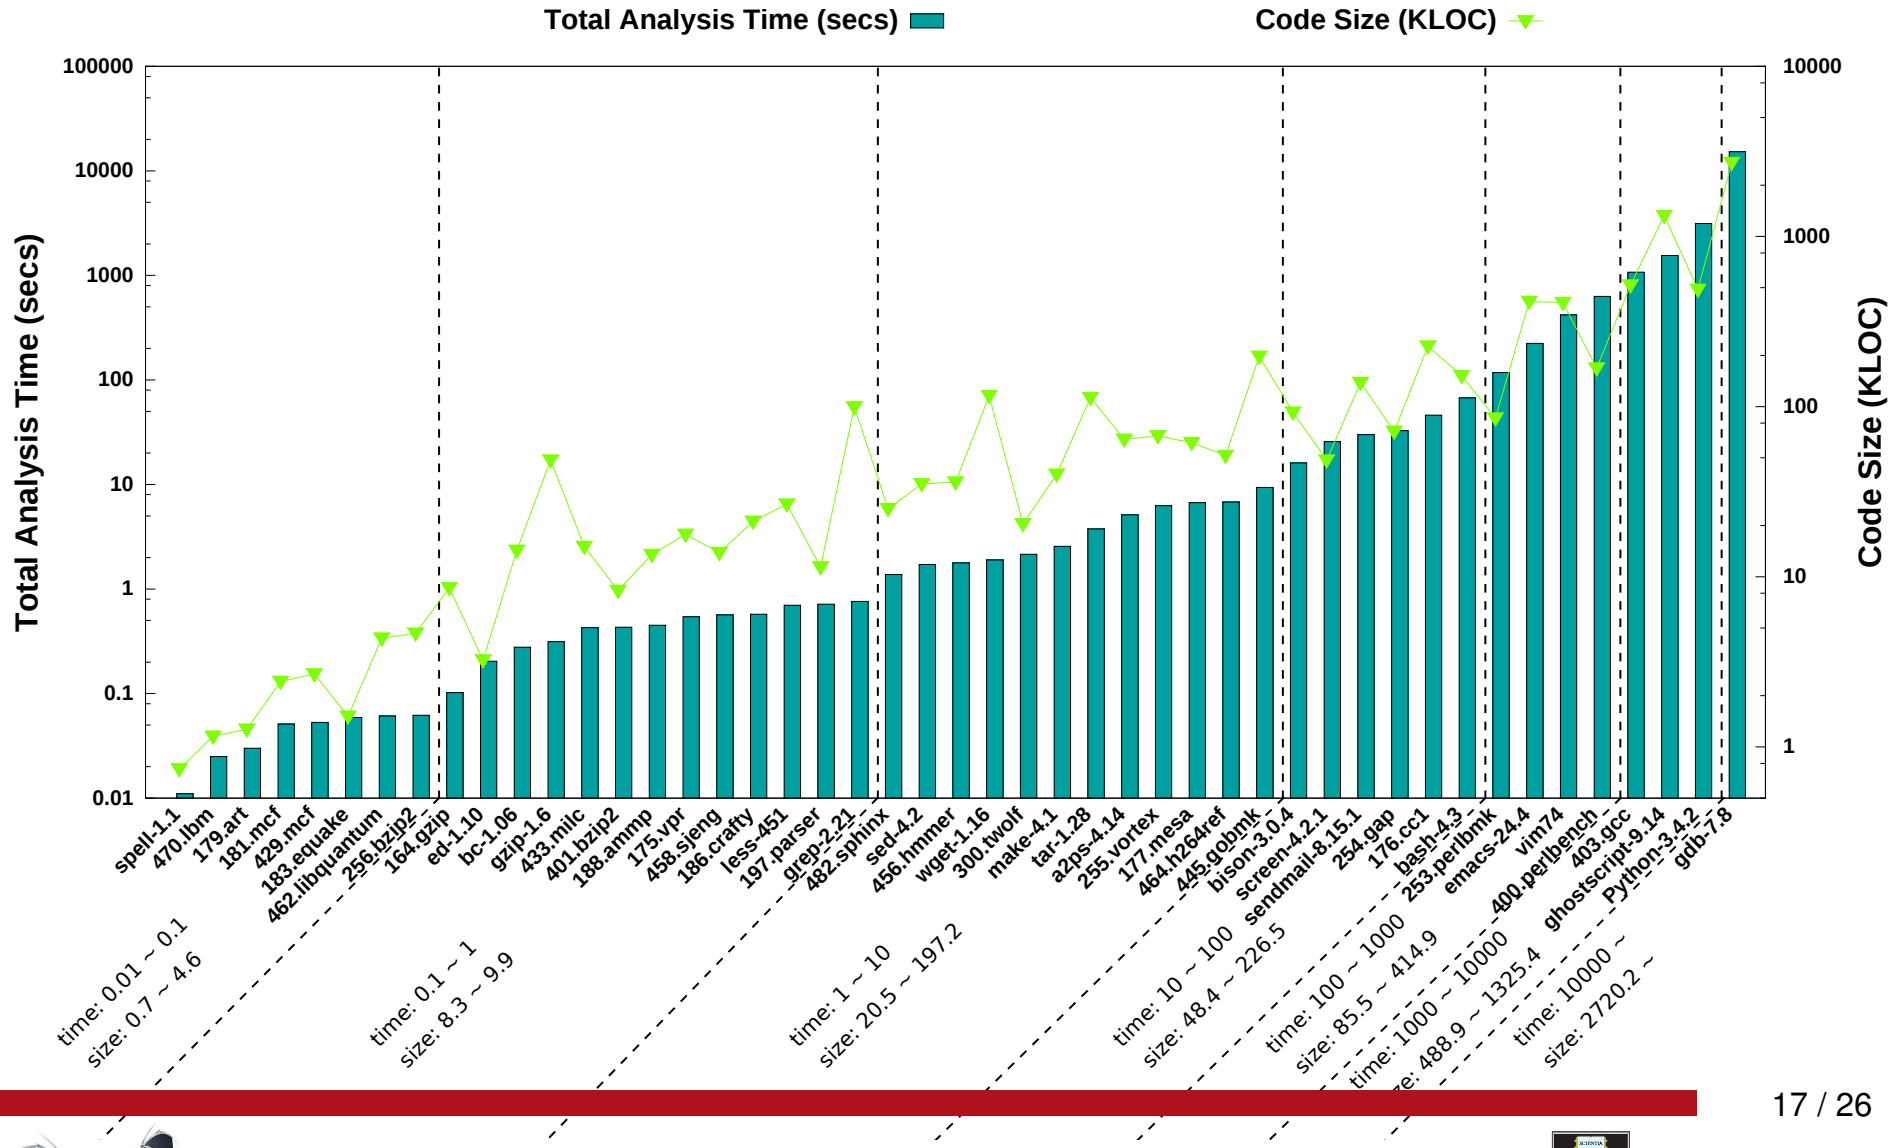
- Static Value-Flow
- SVF Overview
- SVF Internals
  - Pointer Analysis
  - Interprocedural Memory SSA
  - Value-Flow Construction
  - Supporting Multithreaded Programs
- Results and Client Applications

Evaluation and Results

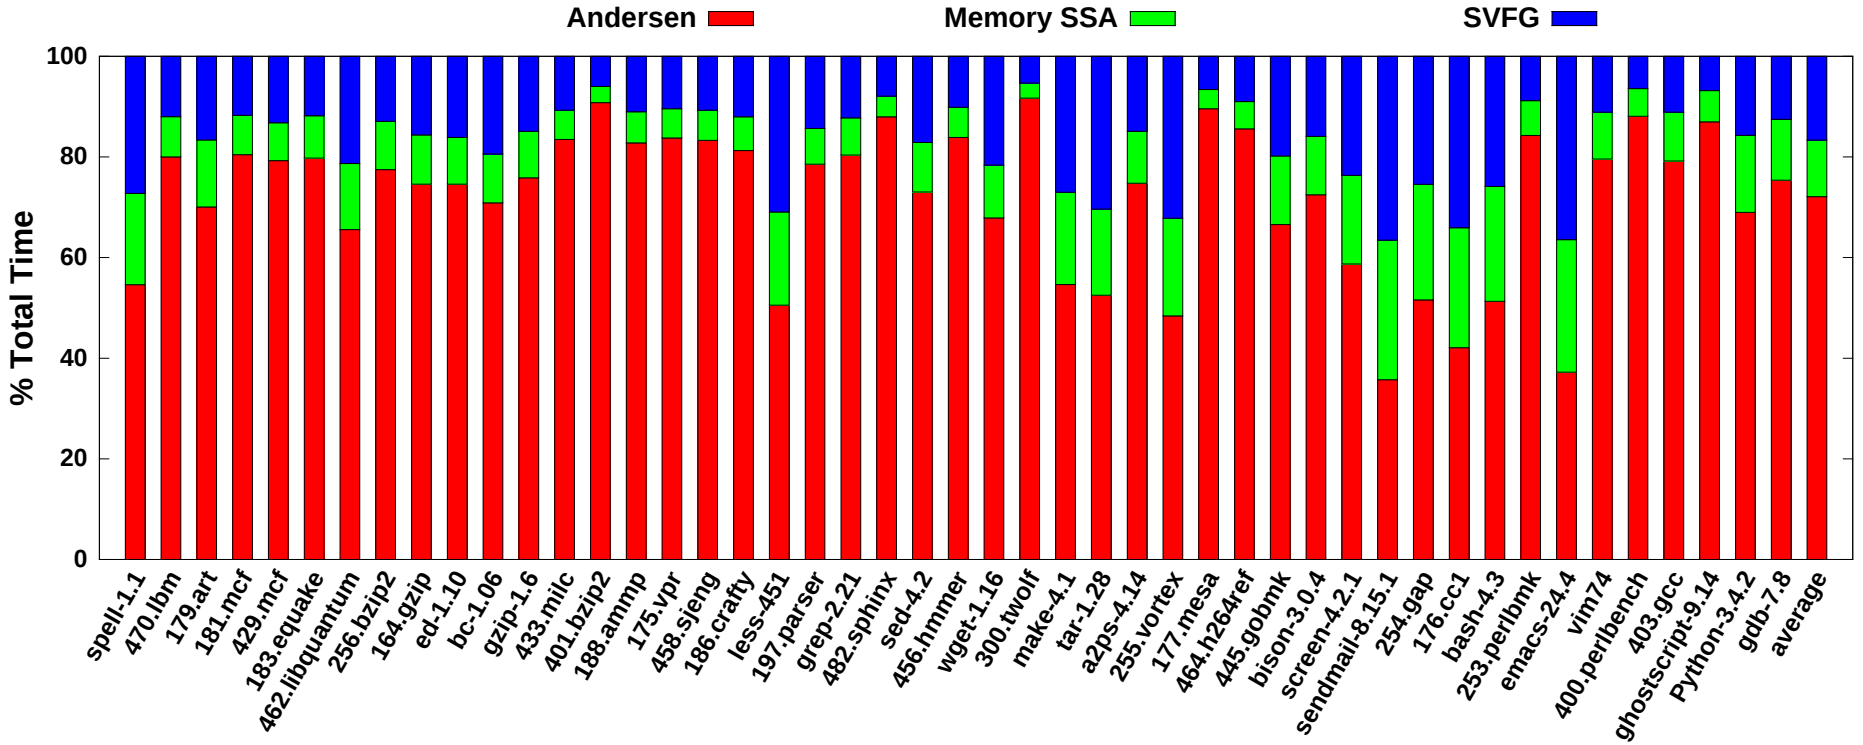
- Benchmarks:
  - All SPEC C benchmarks: 15 programs from CPU2000 and 12 programs from CPU2006
  - 20 Open-source applications: most of them are recent released versions.
  - Total lines of code evaluated: 8,005,872 LOC with maximum program size 2,720,279 LOC
  - Gold Plugin is used to combine multiple bitcode files into one
- Machine setup:
  - Ubuntu Linux 3.11.0-15-generic Intel Xeon Quad Core HT, 3.7GHZ, 64GB

Analysis Time

Total Analysis Time = Andersen + MemorySSA + VFG

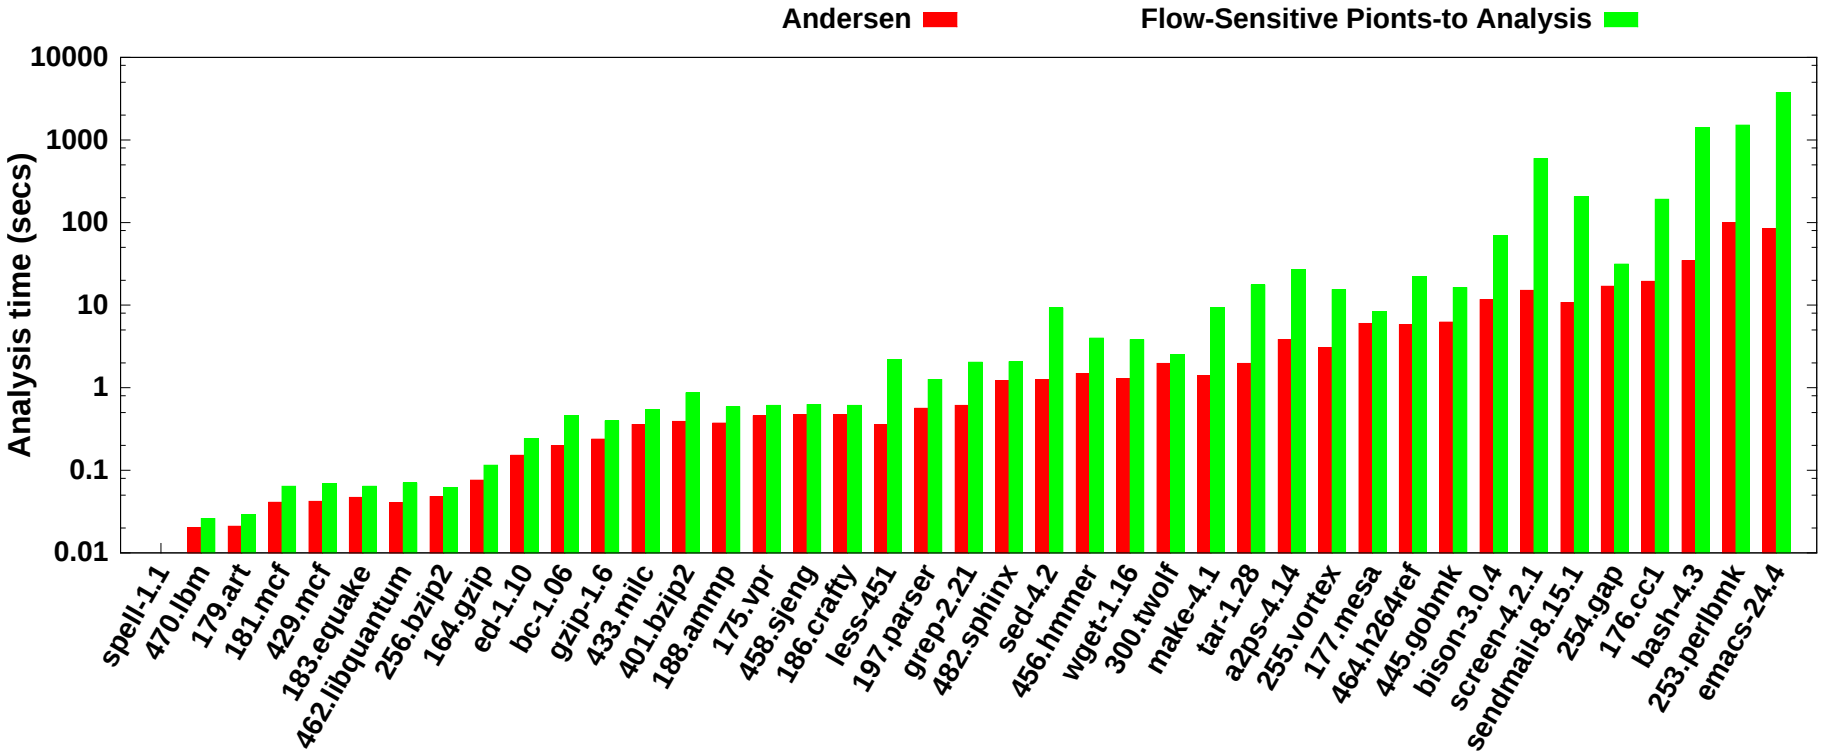


Analysis Time Distribution



Average Percentage: Andersen (71.9%), Memory SSA (11.3%), VFG (16.8%)

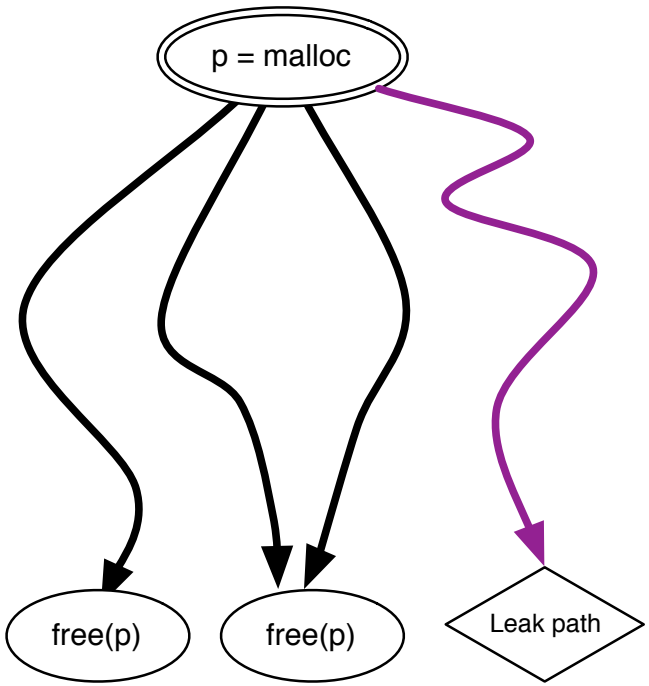
Analysis Time : Andersen v.s. Flow-Sensitive Points-to Analysis



Flow-Sensitive Analysis Slowdowns: From 1.2× to 44×. On average 6.5×.

Client 1: Memory Leak Detection (TSE '14, ISSTA '12)

- **Source-Sink Problem**: every object created at an allocation site (**a source**) must eventually reach one free site (**a sink**) during any program execution path.



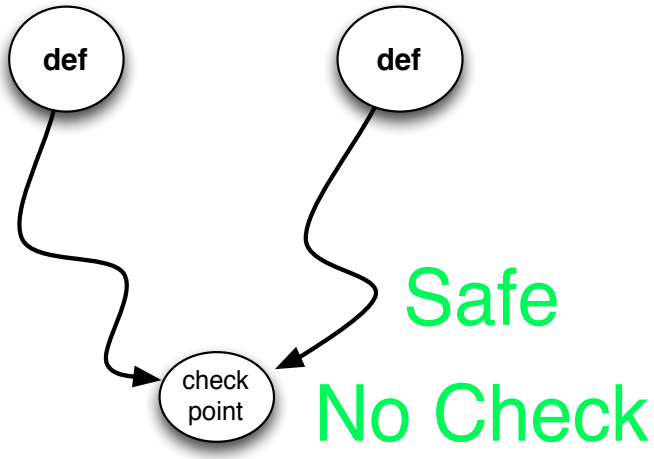
Client 1: Memory Leak Detection (TSE '14, ISSTA '12)

Leak Detector	Speed (LOC/sec)	Bug Count	FP Rate(%)
ATHENA	50	53	10
CONTRADICTION	300	26	56
CLANG	400	27	25
SPARROW	720	81	16
FASTCHECK	37,900	59	14
SABER	**10,220**	**85**	**19**

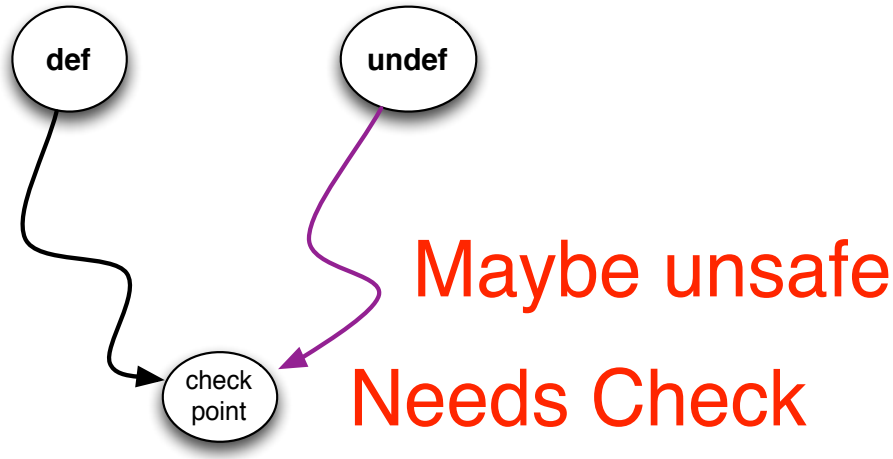
Comparing SABER with other static detectors on analysing SPEC2000 C programs

Client 2: Accelerating Memory Sanitizer (CGO '14)

- Detecting uninitialized variables using source-level instrumentation on LLVM IR[1].



There is no value-flow reachable from an undefined allocation sites



Reachable from an undefined allocation sites along at least one value-flow path

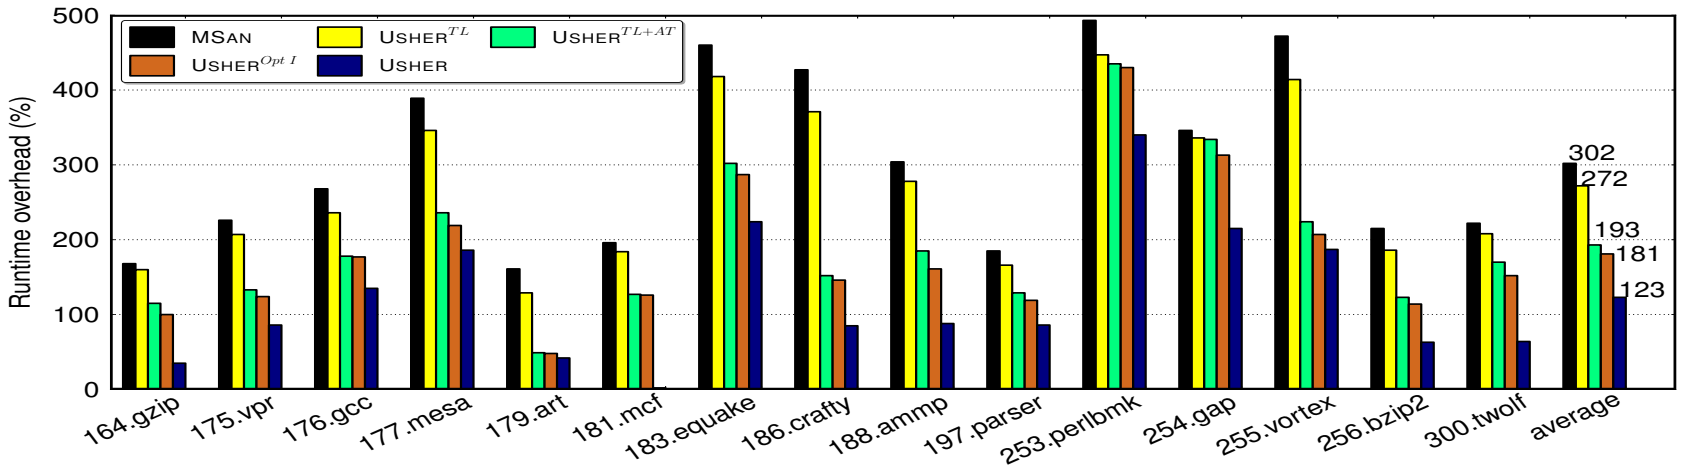
[1] *In C, global variables are default-initialized but local and heap variables are not*

Client 2: Accelerating Memory Sanitizer (CGO '14)

- USHER^{TL}: Direct value-flow via only top-level pointers.
- USHER^{AT}: Direct and indirect value-flow via both top-level and address-taken variables.
- USHER^{Op1}: Reduce shadow propagation. $X \rightarrow Y \rightarrow Z$ reduced to $X \rightarrow Z$.
- USHER: Redundant check elimination. Check c is redundant if all checks flow to c is checked (e.g., double checking *p along control flow).

Client 2: Accelerating Memory Sanitizer (CGO '14)

- USHER^{TL}: Direct value-flow via only top-level pointers.
- USHER^{AT}: Direct and indirect value-flow via both top-level and address-taken variables.
- USHER^{Op1}: Reduce shadow propagation. $X \rightarrow Y \rightarrow Z$ reduced to $X \rightarrow Z$.
- USHER: Redundant check elimination. Check c is redundant if all checks flow to c is checked (e.g., double checking *p along control flow).

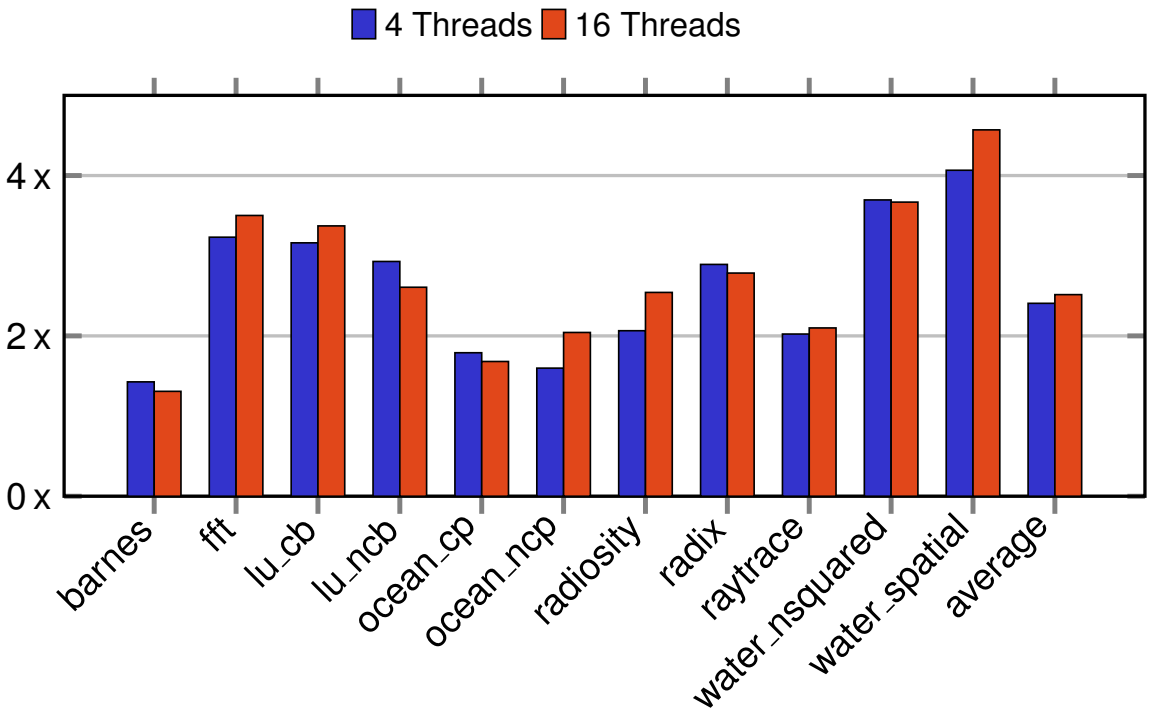


Execution time slowdowns (normalized with respect to native code).

Client 3: Accelerating Thread Sanitizer (PMAM '16)

A check for a memory access is redundant if it has no outgoing or incoming inter-thread (thread-aware) value-flows.

- ThreadLocal
- MHP analysis + Alias analysis + Lock Analysis



Speedups over original TSan (under -O0).

Conclusion and Future Work

- Conclusion
  - A research tool supports refinement-based interprocedural program dependence analysis on top of LLVM
  - Pointer analysis variants
  - Interprocedural memory SSA
  - Value-flow construction
- Future work
  - Advanced Static Analysis
    - C++/Objective-C Support
    - Demand-driven flow-, context- and heap- sensitive analysis (*coming soon*)
  - Bug Detection
    - Use-after-free detection
    - Enforcement of fine-grained control flow integrity (CFI)
    - Accelerating dynamic symbolic execution (Klee or Fuzzer etc.)

- Publicly available open source of SVF (LLVM License)
  `http://unsw-corg.github.io/SVF/`
- Micro benchmarks to validate the correctness of analyses
  `https://github.com/unsw-corg/PTABen`
- A simple Eclipse Plugin
  `https://github.com/unsw-corg/SVF-EclipsePlugin`

Thanks!

Q & A
